

This report is generated by VeritasAI automated forensic analysis and is intended as supporting evidence only. Results are probabilistic, not definitive. Always verify findings with additional sources before taking legal action. VeritasAI (veritasai-g2u6.onrender.com)

SCAN INFORMATION

Scan ID:	tPMvr90KZfgZ	Verdict:	AUTHENTIC
Date:	March 20, 2026 at 12:00 PM UTC	Confidence:	89%
Media Type:	Image	Suspected Model:	Not determined
Input Method:	URL	Platform:	VeritasAI v1.0

ANALYSIS SUMMARY

Analysis complete.

FORENSIC SIGNALS DETECTED

The following signals were identified during analysis:

Skin Texture

[CLEAR]

The skin shows natural pore structure and micro-variation consistent with real photography. There is no evidence of AI smoothing or plastic-like rendering across the face.

Hair Coherence

[CLEAR]

Individual hair strands are clearly defined with natural flow and variation in thickness. The transition between hair and background is consistent with real camera optics.

Eye Reflections

[CLEAR]

Both eyes show consistent catchlight reflections and natural iris detail. Pupil shapes are symmetrical and appropriate for the lighting environment.

Facial Geometry

[CLEAR]

Facial proportions and symmetry are anatomically correct. The ear structure is visible and properly rendered with natural detail.

Lighting Consistency

[CLEAR]

Shadows and highlights are consistent with a single natural light source. Specular reflections on the skin follow expected physics.

Edge Artifacts

[CLEAR]

Subject boundaries show natural blurring consistent with real camera depth of field. No halo effects or composite seams are present.

Semantic Coherence

[CLEAR]

The overall scene is plausible and internally consistent. The subject's expression, makeup, and hair styling form a realistic portrait.

UNDERSTANDING THIS RESULT

How It Was Detected

The image was analyzed using multiple forensic checks that look for signs of AI generation, such as unnatural skin texture, odd hair patterns, or inconsistent lighting. In this case, all signals pointed to a real photograph: the skin has natural pores and variation, the hair shows individual strands with realistic flow, the eyes have matching reflections, and the lighting and shadows follow the rules of real-world physics. No digital manipulation or AI-generated artifacts were found.

What To Look For Yourself

You can check for authenticity by looking closely at the person's skin—real photos show tiny pores and natural texture, not a smooth, plastic-like finish. Examine the hair to see if individual strands are visible and flow naturally. Check both eyes to see if the small white reflections (catchlights) match in size and position. Also, look at the edges of the face and hair against the background—real photos have soft, natural blurring, not sharp or glowing lines.

About The Technology

This image appears to be a genuine photograph taken with a real camera. Authentic photos have natural characteristics like consistent lighting, realistic skin texture, and proper depth of field—meaning parts of the image are softly blurred in a way that matches how camera lenses work. These features are hard for AI to replicate perfectly, and their presence here confirms the image was not generated by artificial intelligence.
